

GRIFFITH COLLEGE DUBLIN

Assignment Cover Sheet

Student name:	Ivan Novik, Andrei-Silviu Serianu, Radu-Constantin Lupu		
Student number:	3127786, 3144757, 3130999		
Faculty:	Computing Science		
Course:		Stage/year:	3
		WT	
Subject:	Web Technologies		
Study Mode:	Full time	☒	Part-time
Lecturer Name:	Ellen Hickey		
Assignment Title:	Assignment 4: Client Side Site Components		
No. of pages:			
Disk included?	Yes	☐	No
			☒
Additional Information:	(ie. number of pieces submitted, size of assignment, A2, A3 etc)		
Date due:	9.05.2026		
Date submitted:	10.05.2026		

Plagiarism disclaimer:

I understand that plagiarism is a serious offence and have read and understood the college policy on plagiarism. I also understand that I may receive a mark of zero if I have not identified and properly attributed sources which have been used, referred to, or have in any way influenced the preparation of this assignment, or if I have knowingly allowed others to plagiarise my work in this way.

I hereby certify that this assignment is my own work, based on my personal study and/or research, and that I have acknowledged all material and sources used in its preparation. I also certify that the assignment has not previously been submitted for assessment and that I have not copied in part or whole or otherwise plagiarised the work of anyone else, including other students.

Signed: _____ x _____ Date: _____ 10.05.2026 _____

Please note: Students **MUST** retain a hard / soft copy of **ALL** assignments as well as a receipt issued and signed by a member of Faculty as proof of submission.

Assignment 4: Finalizing the project

This is the last iteration of the project, so below is a quick revision of what our site is about.

Recipe Hunter

The site is focused on the idea of a page that contains list of recipes, with a crucial addition being giving users ideas of what they can cook using the ingredients they have in their fridge. The site has a list of recipes, which the user can scroll through, picking what they like, modifying it with different filters like- diets, allergies, ingredients used to cook the recipe. Each user can create the account where they can fill out some info about themselves, including specific allergies and diets. Each recipe has its own page which contains the instructions on how to cook it along with some general information about the recipe and the list of ingredients.

Functionalities of Recipe Hunter

- Register/login system based on cookies.
- Custom profile setting which allows for additional filtering.
- List of recipes each of which can be interacted with to get user to the recipe details page.
- Sorting, searching, and filtering systems for the recipe list.
- Interactive pantry zone with different ingredients which can be chosen to make an ingredient-specific filter.

Quality of life features

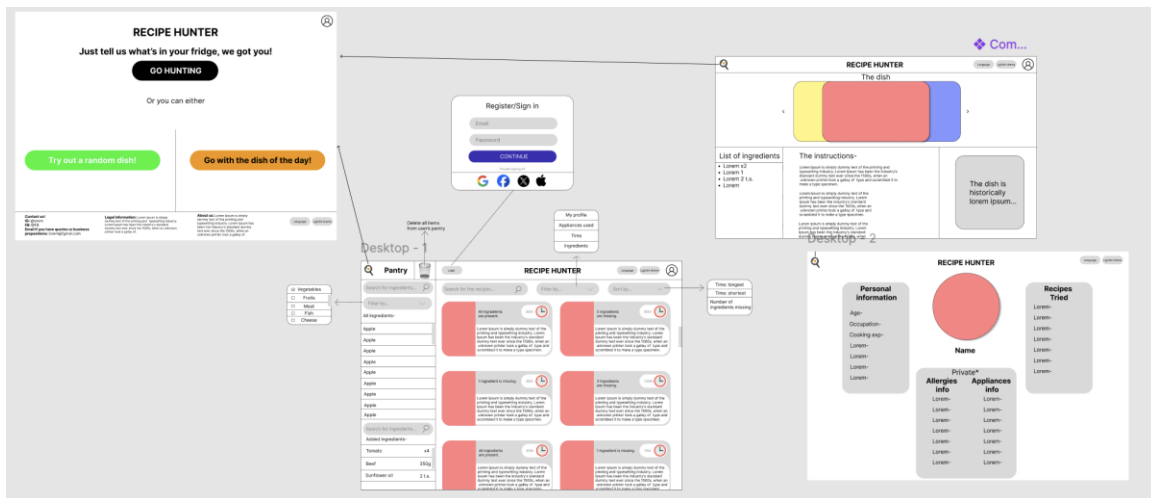

- Light/dark themes.
- Three languages for the main interface- English, Romanian, Ukrainian.
- Landing page with options to try a random dish or the dish of the day.

Timeline of Development

Iteration 1

At this stage we created a project proposal with the general vision of what our site would do and look like. Overall, the idea remained almost unchanged. At that stage only we had the ideas to add cooking appliances as a filtering option and to provide a random recipe based on profile preferences but ultimately decided to discard of those ideas.

Initial wireframes for our site:

Iteration 2

In this iteration we implemented essential backend for our site along with databases for recipes and users.

We ran checks, confirming that everything works; CRUD, registration/login, and the entry points.

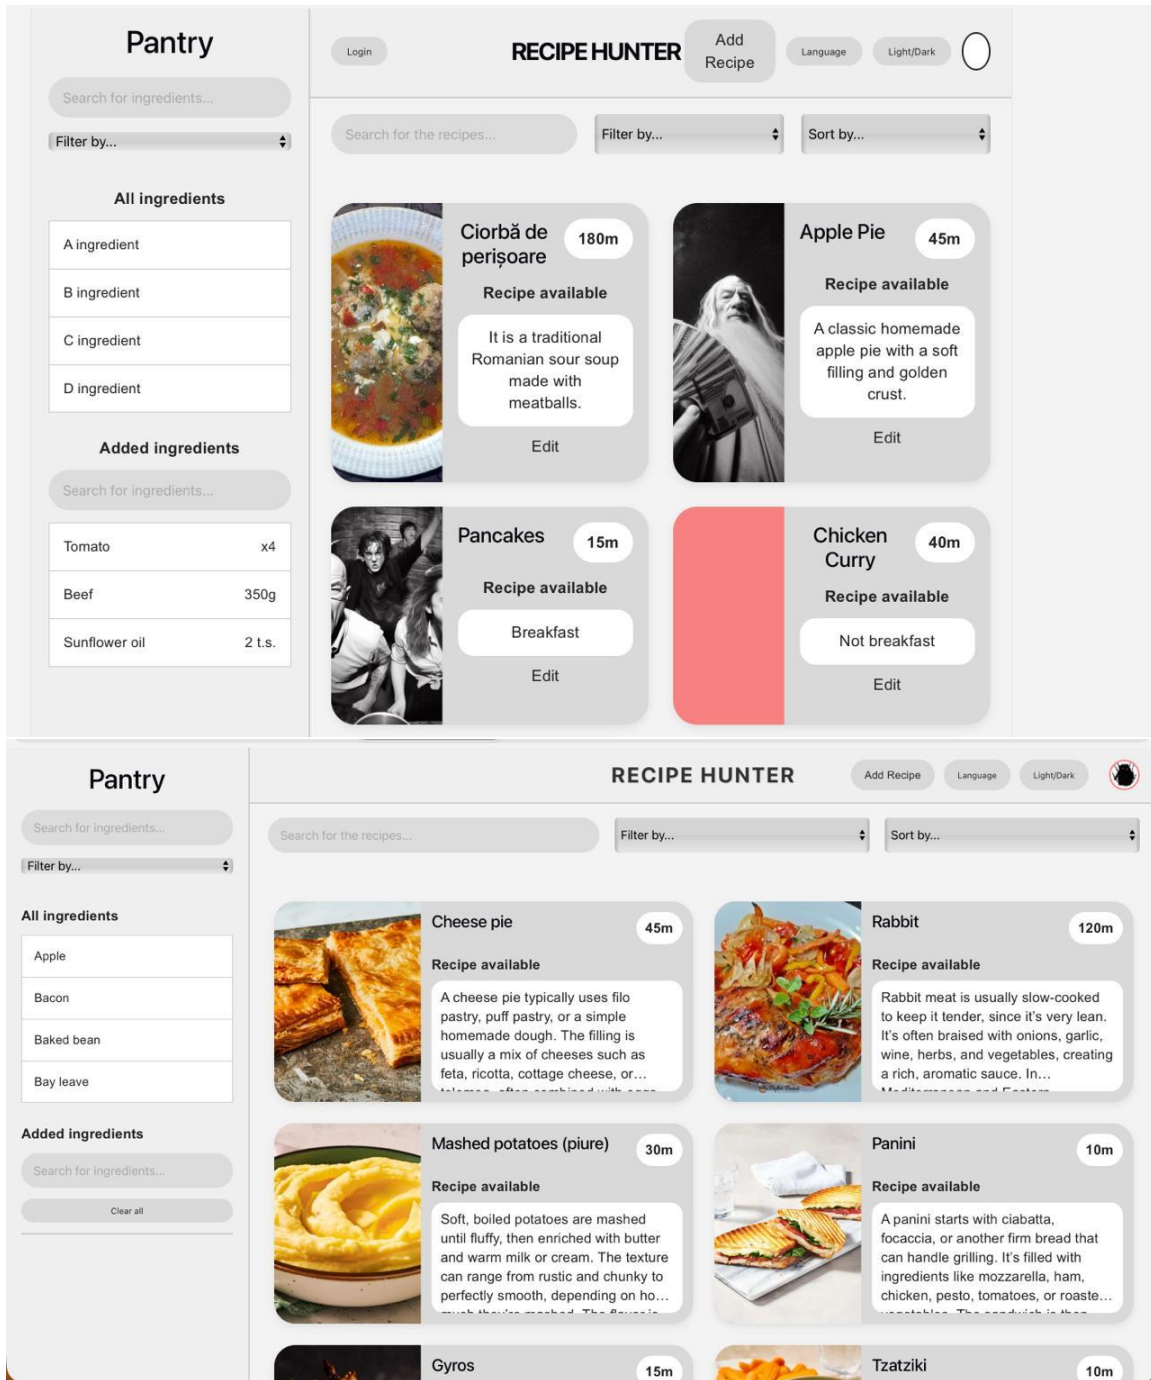

At that stage we already had basic UI to test different functionalities and see if they work with the interface.

Despite having a task of deploying backend only, we did successfully deploy the frontend connecting it to the backend as well.

We implemented aspects like: recipe addition, filtering, sorting, editing, and pantry-ingredients recipe filtering.

We also added user registration/login system at the time, but it did not have additional functionality other than being a decor.

At this point we pretty much had the core of our site complete.

Commitment of each team member during the 2nd stage:

Ivan Novik:

- Set up the project and the DB.
- Created initial recipe list and recipe details pages.
- Implemented ingredient normalization and pantry-driven recipe filtering.
- Improved recipe card layout and recipe detail page UX.
- Added backend helpers for consistent ingredient storage and cleanup.

- Implemented addition/editing of the recipes on the site.

Andrei-Silviu Serianu:

- Gathered recipes from Romania, Ukraine to promote the cultural diversity of Ireland. There are also some international recipes.
- Worked with the Database, implementing all the recipes with ingredients, time to cook, type of food and with images.
- Created a Home Page, from where the user can use the navbar, select a random dish from our collection, or choose today's specialty: Mamaliga (polenta)
- Reworked the Navbar to accomplish a better and more accessible "flow" between pages for the user.
- Some minor bug fixes in the code as a whole.

Radu Constantin Lupu:

- Developed the User Authentication system (Register/Login).
- Implemented Base64 Image Processing for local profile picture uploads.
- Built the Dynamic Profile Page with real-time editing and database synchronization.
- Optimized Backend API to handle large data payloads (10MB limit).
- Standardized the Global UI/UX (Navbar, consistent form styling, and dark/light modes).

Iteration 3

In the third iteration we were working on improving the UI.

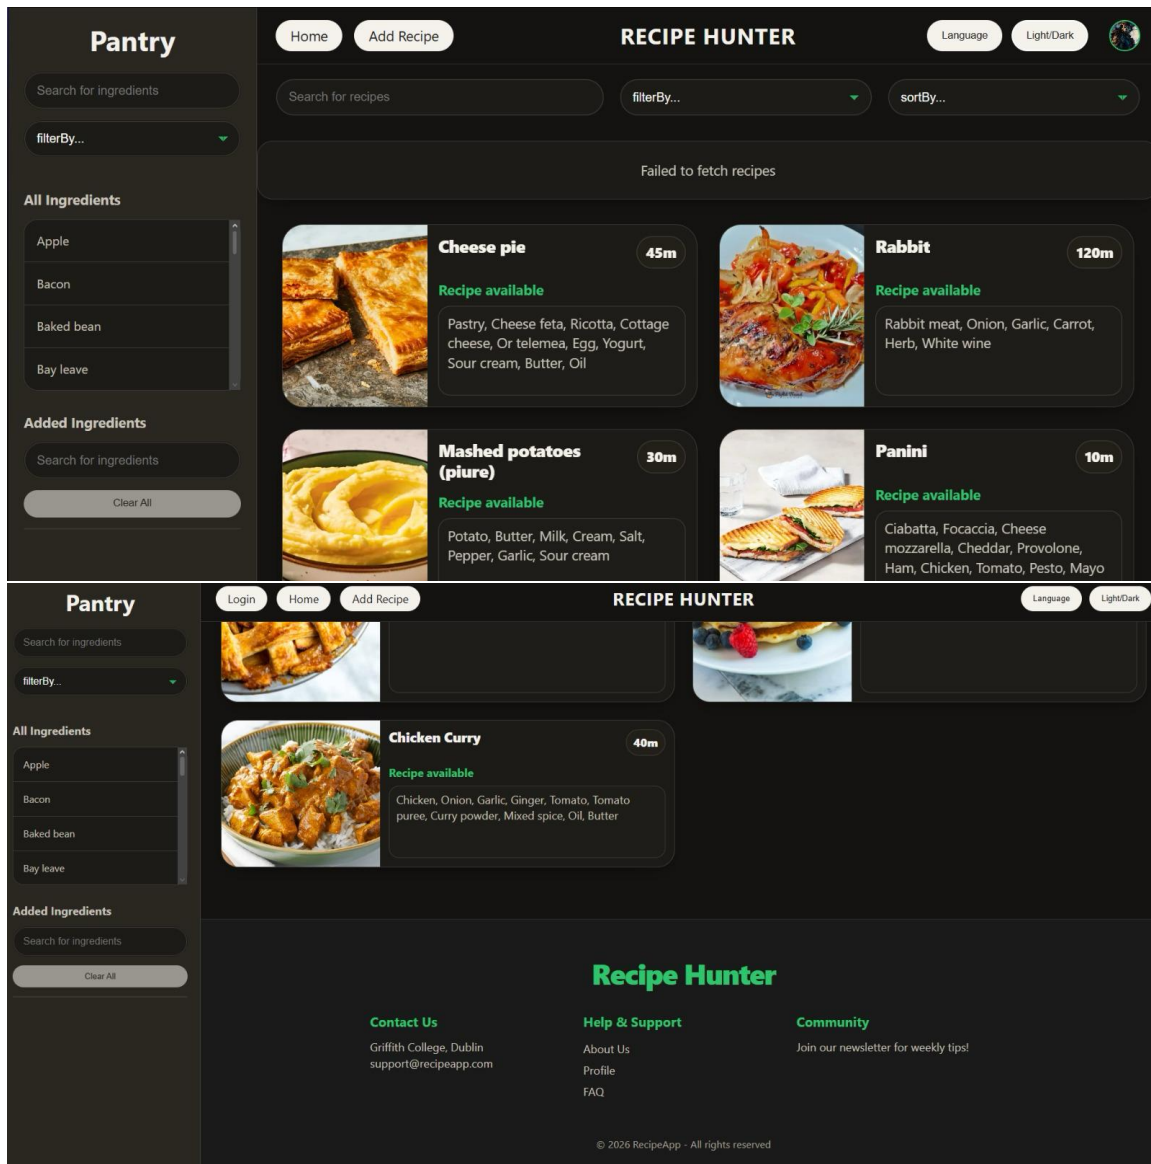

We fixed the positions and proportions of most objects around the site, added footer, media queries, made all the buttons functional and decided on the color scheme.

This stage was the longest by feeling, but it was exciting to implement things which directly influence how the site looks. This iteration led us to how the site looks now.

The layout of the RecipeList page was influenced by the site supercook.com which has similar usage to our site.

Whereas when it came down to overall design choice, we decided to go with hellofresh.com, since it still strongly touches recipes topic, has modern fresh look and not difficult to implement.

Still, we had a lot to work on in the backend as well.

Contribution of each member during 3rd iteration.

The work in the frontend was divided evenly between the group members.

Ivan Novik:

- Improved UI/UX with styling updates, sticky header/pantry, and dark mode.
- Implemented and fixed pantry filtering functionality.
- Refactored and merged branches.
- Wrote documentation for the 3rd iteration.
- Improved UI navigation (home button and logo behaviours).
- Added Ukrainian language support (translation + filtering/sorting updates).
- Enhanced sorting and filtering features.
- Made media queries.

Andrei-Silviu Serianu:

- Implemented the language function on the site.
- Continued to implement the translation functions on everything my colleagues did afterwards.
- Created the English and Romanian translation.
- Fix major critical bug in the database involving the recipes.
- Fixed the footer.
- Fixed all the bugs related with the page transfers.
- Created the main page that the user ends up in when the page is opened.
- Modified the navbar.
- Helped fixing the website structure.

Radu Constantin Lupu:

- Fixed translation crashes by restoring useTranslation hooks.
- Resolved Vite production build syntax errors.
- Fixed logout/login function bugs.
- Resolved API import crashes by standardizing on a single default export in the Axios configuration.
- Synchronized frontend API request paths to match backend userRoutes for login, registration, and profile updates.
- Standardized the authentication flow to use consistent endpoints across the application.
- Overhauled the Profile Page layout to prevent content from overlapping with the Navbar.
- Pinned the Footer to the bottom of the viewport using Flexbox layout logic.
- Created features for the Profile page to make it user friendly.
- Used regex verification.
- Implemented data sanitization.

Iteration 4

After getting some feedback at the presentation, we quickly established ourselves a list of objectives for the last iteration. The improvements were both visual and functional.

We refined the UI of several buttons, added an unbelievably cool, freedom-inducing picture-logo instead of staying with the text-based one, changed the way profile icon appears in the header, tinkered with the positions of the objects on the profile page and put header in the burger menu, when media queries are being used.

We also implemented diets and allergies in the profile page, which improves personal recipe filtering by a lot.

Each member's contribution during 4th iteration:

Ivan Novik:

- Implemented diets and allergies on the profile page as well as sorting by them.
- Made header transform into burger menu when media queries are triggered.
- Merged branches.
- Added logo.
- Added new translations to the new content.
- Final documentation.

Andrei-Silviu Serianu:

- Small bug fixes.
- Made some changes to the recipes to mimic reality better.
- Helped my teammates while they were working on the site
- Modified the final document

Radu Constantin Lupu:

- Fixed backend schema mismatch and added an api endpoint.
- Implemented admin approval endpoints for pending, rejected, and status updates.
- Built Admin Approvals page with approve/reject actions and rejected list.
- Added Profile "My Recipes" section with pagination and status badges.
- Implemented image upload on Add/Edit recipe pages.
- Enforced edit permissions: owners or admins only; owner edits become pending.
- Added i18n keys and translations (en/ro/ua) for admin and profile texts.
- Improved CSS Added client-side per-endpoint error handling and a debug toggle for auth/token inspection.
- Added role, status, and createdBy fields to the database schemas.
- Created custom middleware to verify user tokens and check for admin privileges.
- Secured the create and edit routes using the new token middleware.
- Modified the public feed to exclusively display "approved" recipes.
